"Structure of the human N-cadherin gene: YAC analysis and fine chromosomal mapping to 18q11.2.";

Genomics 22:172-179(1994)

-1- FUNCTION: CADHERINS ARE CALCIUM DEPENDENT CELL ADHESION PROTEINS.

"THEY PREFERENTIALLY INTERACT WITH THEMSELVES IN A HOMOPHILIC MANNER IN CONNECTING CELLS; CADHERINS MAY THUS CONTRIBUTE TO THE SORTING OF HETEROGENEOUS CELL TYPES. N-CADHERIN MAY BE INVOLVED IN NEURONAL RECOGNITION MECHANISM.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                modulator, a central nervous system modulator or a pancreatic function modulator. This ligand could have specific applications as a prophylactic or therapeutic agent for dementia, depression, hyperkinetic syndrome, disturbance of consciousness, anxiety syndrome, schizophrenia, trauma, growth hormone secretory disease, hyper-and polyphagia, hyperripidaemia, hypercholesterolaemia, hyper-glyceridaemia, hypercholesterolaemia, hyper-glyceridaemia, hyperprolactinaemia, diabetes, cancer, pancreatitis, renal disease, hyperprolactinaemia, neurosis, asthma, rheumatoid arthritis, spinal injury, transient brain ischaemia, epilepsy, amylotrophic lateral sclerosis, acute myocardial infarction, infertility, spinocerebellar degeneration, bone fracture, trauma, atopic dermatitis, osteoporosis and/or oligogalactia. Assays can also be developed to screen compounds which are capable of altering the binding activity of the ligand affecting activation of the G protein-coupled receptor protein.

The agents for modulating placental function can be used for treating or preventing modulating placental function can be used for treating or preventing modulating placental function can be used for treating or preventing modulating placental function can be used for treating or preventing modulating placental function can be used for treating or preventing modulating placental function can be used for treating or preventing modulating placental function can be used for treating or preventing modulating placental function can be used as contraceptives.
             Physiologically-active polypeptide recognized as ligand by G protein-coupled receptor protein, for promoting secretion of as drugs for diseases relating to oxytocin secretion and in v
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence represents a human type ligand fragment. It is used in the course of the invention. The specification describes an agent for modulating prolactin secretion which comprises a ligand polypeptide or a salt, for a G protein-coupled receptor (GPCR) protein. The agents for promoting prolactin secretion can be used for treating or preventing hypocvarianism, gonecyst cacogenesis, menopausal syndrome, euthyroid or hypometabolism. They can by used for promoting lactation in a domestic mammal and as an aphrodista. The agents for inhibiting prolactin secretion can be used for treating or preventing pitulitary adenomatosis, brain tumour, emmenlopathy, autoimmune disease, prolactions in factorial the secretion can be used for treating or preventing pitulications.
                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; oxytocin secretion promoter; G protein-coupled recept treatment; disease; pain; atonic bleeding; uterine recovery caesarean section; artificial fertilization; galactostasis; veterinary medicine; milk production.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Use of G protein-coupled receptor ligands - for modulating prolactin secretion or placental function, e.g. for treating menopausal syndrome, tumours, autoimmune disease or abnormal pregnancy
                                                                                                                                                                                  (TAKE ) TAKEDA

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           which contains a ligand peptide or its salt for the G protein coupled receptor protein. It is useful in the form of drugs for ameliorating, preventing and treating diseases relating to oxytocin secretion e.g. weak pains and atonic bleeding, before and after expulsion of placenta, uterine recovery failure, caesarean section, stoppage of artificial fertilization or galactostasis and is also applicable in veterinary medicine for promoting milk production in cow, goat and pig. This sequence represents a human peptide which acts as an oxytocin secretion
regulatory mechanism (e.g. promotion of prolactin secretion), central nervous regulatory mechanism, and pancreatic function regulatory mechanism. The antibody-based immunoassay can also be applied in clarifying the physiological functions of the ligand and its derivative Sequences AAY49290-302 represent peptide fragments of the 19P2 ligand
                                                         The invention provides a monoclonal antibody which has a specific reaction with the part peptide of the C-terminal of 19p2 ligand or its derivative. The antibodies can be used in diagnosis or to treat or prevent diseases associated with abnormality in the pituitary function
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   which

                                                                                                                                                                                   The present invention describes a modified therapeutic peptide (I) C comprising a therapeutically active amino acid region (III) and a cid reactive group (II) (e.g. succinfinity) and maleimido groups) attached to a less therapeutically active amino acid region (IV), which covalently c bonds with amino/hydroxyl/thiol groups on blood components to form a peptidase stabilised therapeutic peptide composed of 3-50 amino acids. (I) are useful for modifying therapeutic peptides e.g. hormones, growth factors and neurotransmitters, to protect them from peptidase activity in vivo for the treatment of various disorders. Endogenous therapeutic peptides are not suitable as drug candidates as they require frequent administration due to rapid degradation by peptidases in the body. Modifying and attaching therapeutic peptides to albumin prevents or reduces the action of peptidases to increase length of activity (half life) and specificity as bonding to large molecules decreases intracellular uptake and interference with physiological processes. AbB90829 to AbB92441 represent peptides which can be used in the exemplification of the present invention.

Pharmaceutical compositions containing this ligand may be used as a pituitary function CC modulator. This ligand could have specific applications as a CC prophylactic or therapeutic agent for dementia, depression, hyperkinetic Syndrome, disturbance of consciousness, anxiety syndrome, schizophrenia, CC trauma, growth hormone secretory disease, hyper and polyphagia, CC hyperlipidaemia, hypercholesterolaemia, hyperglyceridaemia, for trauma, growth hormone secretory disease, hyper and polyphagia, CC hyperprolactinaemia, diabetes, cancer, pancreatitis, renal disease, CC Turner's syndrome, neurosis, asthma, rheumatoid arthritis, spinal injury, transient brain ischaemia, epilepsy, amylotrophic lateral sclerosis, CC acute myocardial infarction, infertility, spinocerebellar degeneration, CC compalectia. Assays can also be developed to screen compounds which are CC capable of altering the binding activity of the ligand affecting CC activation of the G protein-coupled receptor protein.
                                                                                                                                                                                                                                                                                                                     Query Match

It is useful in the form of drugs for ameliorating, preventing and treating diseases relating to oxytocin secretion e.g. weak pains and atonic bleeding, before and after expulsion of placenta, uterine recovery failure, caesarean section, stoppage of artificial fertilization or galactostesis and is also applicable in veterinary medicine for promoting milk production in cow, goat and pig. This sequence represents a human peptide which acts as an oxytocin secretion
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human; oxytocin secretion promoter; G protein-coupled receptor protein; treatment; disease; pain; atonic bleeding; uterine recovery failure; co caesarean section; artificial fertilization; galactostasis; goat; pig;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present sequence describes a method of controlling the secretion of corticotrophin releasing hormone (CRH), involving the use of a G protein receptor ligand. This can be used to control the secretion of CRH and is useful as an analysist or for treating, preventing or ameliorating diseases associated with CRH secretion such as hyperaldosteronism, hypercortisolaemia, secondary or chronic hypoadrencorticism, Addison's disease (including boredom, nausea, pigmentation, hypogonadism, hair loss, and hypotension), adrenal gland hypofunction and obesity. The presents sequence is a peptide used in the exemplification of the
                                                                                                                                                                                                                                            Human type G
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Use of G protein receptor ligand or peptide corticotropin releasing hormone secretion -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             CC ligand polypeptide corresponding to amino acid residues 34 to 55 of the CC sequence represented in AAW3139 and is used in an assay to monitor CC ligand binding to the G protein-coupled receptor protein. Pharmaceutical CC compositions containing this ligand may be used as a pituitary function CC modulator, a central nervous system modulator or a pancreatic function CC modulator. This ligand could have specific applications as a CC prophylactic or therapeutic agent for dementia, depression, hyperkinetic syndrome, disturbance of consciousness, anxiety syndrome, schizophrenia, CC syndrome, disturbance of consciousness, anxiety syndrome, schizophrenia, CC trauma, growth hormone secretory disease, hyper-and polyphagia, CC hyperlipidaemia, hypercholasterolaemia, hypergriyceridaemia, CC furner's syndrome, neurosis, astima, rheumatoid arthritis, spinal injury, CC translent brain ischaemia, epilepsy, amylotrophic lateral selerosis, accute myocardial infarction, infertility, spinocerebellar degeneration, CC bone fracture, trauma, atopic dermatitis, osteoporosis and/or CC capable of altering the binding activity of the ligand affecting CC activation of the G protein-coupled receptor protein.

       The present sequence describes a method of controlling the secretion of corticotrophin releasing hormone (CRH), involving the use of a G protein receptor ligand. This can be used to control the secretion of CRH and is useful as an analysesic or for treating, preventing or ameliorating diseases associated with CRH secretion such as hyperaldosteronism, hypercortisolaemia, secondary or chronic hypoadrenocorticism, Addison's disease (including boredom, nausea, pigmentation, hypogonadism, hair loss, and hypotension), adrenal gland hypofunction and obesity. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  which contains a ligand peptide or its salt for the G protein coupled receptor protein. It is useful in the form of drugs for ameliorating, preventing and treating diseases relating to oxytocin secretion e.g. weak pains and atonic bleeding, before and after expulsion of placenta, uterine recovery failure, caesarean section, stoppage of artificial fertilization or galactostasis and is also applicable in veterinary medicine for promoting milk production in cow, goat and plg. This sequence represents a human peptide which acts as an oxytocin secretion
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      as drugs

hyperilpidaemia, hypercholesterolaemia, hyperglyceridaemia, hyperprolactinaemia, diabetes, cancer, pancreatitis, renal disease, hyperprolactinaemia, diabetes, cancer, pancreatitis, renal disease, furner's syndrome, neurosis, asthma, rheumatoid arthritis, spinal injury, transient brain ischaemia, epilepsy, amylotrophic lateral sclerosis, acute myocardial infarction, infertility, spinoccrebellar degeneration, bone fracture, trauma, atopic dermatitis, osteoporosis and/or oligogalactia. Assays can also be developed to screen compounds which are capable of altering the binding activity of the ligand affecting activation of the G protein-coupled receptor protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        18-SEP-1996;

                                                                                                                            ligand polypeptide corresponding to amino acid residues 23 to 53 of the sequence represented in AAW31390 and is used in an assay to monitor ligand binding to the G protein-coupled receptor protein. Pharmaceutical compositions containing this ligand may be used as a pituitary function modulator, a central nervous system modulator or a pancreatic function modulator. This ligand could have specific applications as a prophylactic or therapeutic agent for dementia pelication, hyperkinetic syndrome, disturbance of consciousness, anxiety syndrome, schizophrenia, trauma, growth hormone secretory disease, hyper- and polyphagia, hyper-lightsemia hyper-lightsemia hyper-lightsemia hyper-lightsemia
                                                                                                                                                                                                                                                                                                   Claim

an agent for modulating prolactin secretion which comprises a ligand polypeptide or a salt, for a G protein-coupled receptor (GPCR) CC protein. The agents for promoting prolactin secretion can be used for treating or preventing hypovarianism, gonecyst cacogenesis, menopausal CC syndrome, euthyroid or hypometabolism. They can by used for promoting CC lactation in a domestic mammal and as an aphrodisiac. The agents for CC inhibiting prolactin secretion can be used for treating or preventing CC prolactinoma, infertility, impotence, amenorabe, galactorrhea, CC acromegaly, Chiari-Frommel syndrome, Argonz-del Castilo syndrome, CC acromegaly, Chiari-Frommel syndrome, Argonz-del Castilo syndrome, The agents for CC modulating placents can also be used as contraceptives. The agents for CC choriocarcinoma, infertilitomal suced as contraceptives. The agents for The inhibitory agents can also be used for treating or preventing CC choriocarcinoma, hydatid mole, irruption mole, abortion, unthrifty fetus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       RESULT

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             SXX
     This is the amino acid sequence of the human pituitary G
protein-coupled receptor ligand 19P2L. A method suitable for
C commercial high-level production of 19P2L comprises expressing
C the ligand in host cells as a recombinant fusion protein e.g. with
C human basic fibroblast growth factor (see AAV83796-97) that has
C been modified to include an N-terminal cysteine residue. The
C ligand is released from the fusion by cyanylation followed by
C ammonolysis. 19P2L has prolactin secretion-stimulating and (at
high doses) prolactin secretion-inhibiting properties. It can be
C used in the treatment and prevention of various diseases including:
C senile dementia, cerebrovascular dementia, and dementia associated
C with: genealogical disorders (e.g. Alzheimer's disease, Parkinson's
C disease, Pick's disease, Huntington's disease), infectious diseases
C disease, Pick's disease, Huntington's disease), infectious diseases
C diseases (e.g. hypothyroidism, vitamin B12 deficiency, alcoholism,
C intoxication by drugs, metal and organic compounds), tumourigenic
C diseases (e.g. brain tumour), traumatic diseases (e.g. chronic
C subarachnoidal heamorrhage, and other types of dementia, depression,
C hyperactive child syndrome (microencephalopathy) and disturbance of
C consciousness. It is also useful for prevention and treatment of
C diseases associated with prolactin hypo and hypersecretion
C breast cancer, infertility, impotence and autoimmune disease
C hyperactive on diseases, and seminal vesicle brooplasia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Query Match

```

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Title: Perfect score: Sequence: US-09-446-543A-73\_COPY\_5\_21 86 1 NPAWYXXRGIRPVGRFX 17

Scoring table: BLOSUM62 Gapop 10.0 , Gapext 0.5

Searched: 105224 segs, 38719550 residues

Total number of hits satisfying chosen parameters: 105224

Minimum DB seq length: 0
Maximum DB seq length: 2000000000

Post-processing: Minimum Match 0% Maximum Match 100% Listing first 45 summaries

Database : SwissProt\_40:\*

Pred. No. 1s the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and 1s derived by analysis of the total score distribution.
